Using vagrant to create two machines and network between them.

Here is a quick explanation of what Vagrant is and how to use it. The gist is that I'm creating two virtual machines and giving them a private network for them to talk to each other.

https://scotch.io/courses/getting-started-with-vagrant-for-local-development/what-is-vagrant

```
# -*- mode: ruby -*-
# vi: set ft=ruby :

# Vagrant multi-machine sample setup

Vagrant.configure("2") do |config|
    config.vm.define :alpha do |alpha|
        alpha.vm.box = "hashicorp/precise64"
        alpha.vm.network :private_network, ip: "10.0.0.10"
        alpha.vm.hostname = "alpha"
    end

config.vm.define :beta do |beta|
    beta.vm.box = "hashicorp/precise64"
    beta.vm.network :private_network, ip: "10.0.0.11"
    beta.vm.hostname = "beta"
    end
end
```

Start them up and then confirm that they are running. At this point I have two virtual machines running on my laptop. They are called **ALPHA** and **BETA**.

Next I'll connect to them in two separate windows using vagrant's ssh tool.

Alpha (IP address 10.0.0.10)

```
chad@brakebills:~/code/Cybersecurity-work-class/classes/CIS311/week2$ ~/Downloads/vagrant ssh alpha
Welcome to Ubuntu 12.04 LTS (GNU/Linux 3.2.0-23-generic x86_64)

* Documentation: https://help.ubuntu.com/
New release '14.04.6 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

Welcome to your Vagrant-built virtual machine.
Last login: Wed Feb 19 04:19:05 2020 from 10.0.2.2
vagrant@alpha:~$ hostname -I
10.0.2.15 10.0.0.10
```

Beta (IP address 10.0.0.11)

```
chad@brakebills:~/code/Cybersecurity-work-class/classes/CIS311/week2$ ~/Downloads/vagrant ssh beta
Welcome to Ubuntu 12.04 LTS (GNU/Linux 3.2.0-23-generic x86_64)

* Documentation: https://help.ubuntu.com/
New release '14.04.6 LTS' available.
Run 'do-release-upgrade' to upgrade to it.

Welcome to your Vagrant-built virtual machine.
Last login: Wed Feb 19 04:22:15 2020 from 10.0.2.2

Vagrant@beta:~$ hostname -I
10.0.2.15 10.0.0.11
```

So the next step is to use the tool tcpdump. It allows you to capture all network traffic coming into or out of a machine. (https://www.tecmint.com/12-tcpdump-commands-a-network-sniffer-tool/) So in essence I'm going to listen in on the traffic coming from ALPHA to BETA. To make this simpler, I'll only listen for ICMP traffic generated when you use the ping command

```
vagrant@beta:~$ sudo tcpdump -nl -i any icmp &
[2] 1805
vagrant@beta:~$ tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
Listening on any, link-type LINUX_SLL (Linux cooked), capture size 65535 bytes
```

Now over on ALPHA, I'll send a single ping to BETA.

```
vagrant@beta:~$ sudo tcpdump -nl -i any icmp &
[2] 1805
vagrant@beta:~$ tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on any, link-type LINUX_SLL (Linux cooked), capture size 65535 bytes
```

Over on BETA we immediately see that the ping request came in and a reply was sent.

```
04:39:03.138746 IP 10.0.0.10 > 10.0.0.11: ICMP echo request, id 1805, seq 1, length 64
04:39:03.139864 IP 10.0.0.11 > 10.0.0.10: ICMP echo reply, id 1805, seq 1, length 64
04:39:03.138746 IP 10.0.0.10 > 10.0.0.11: ICMP echo request, id 1805, seq 1, length 64
04:39:03.139864 IP 10.0.0.11 > 10.0.0.10: ICMP echo reply, id 1805, seq 1, length 64
```

So at this point I have two machines, I have a way to trigger traffic from one machine to the other, and on the receiving machine I can see that incoming traffic. Now onto sending a ping with a forged return address. For this example, I'm going to use hping3 but there are a lot of tools that do the same thing. (https://tools.kali.org/information-gathering/hping3) So let's set the spoofed return address to 8.8.8.8 which means that once I send the ping I will not get a return.

ALPHA

```
vagrant@alpha:~$ sudo hping3 -1 -S 10.0.0.11 -a 8.8.8.8 -c 1
HPING 10.0.0.11 (eth1 10.0.0.11): icmp mode set, 28 headers + 0 data bytes
--- 10.0.0.11 hping statistic ---
1 packets transmitted, 0 packets received, 100% packet loss
round-trip min/avg/max = 0.0/0.0/0.0 ms
```

Over on **BETA** we see an incoming icmp packet but this time it looks like it is coming from 8.8.8.8 instead of **ALPHA**.

```
vagrant@beta:~$ tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on any, link-type LINUX_SLL (Linux cooked), capture size 65535 bytes
04:59:53.288307 IP 8.8.8.8 > 10.0.0.11: ICMP echo request, id 19208, seq 0, length 8
```
